CARM Server Changelog

Service Pack 5.7 - 0050

CARM Server:

- Modules of a category can be sorted in the CSS Module Editor in the IQ-Software. This functionality requires the IQ version V7.0 - 0100 or newer. [CARM-156]

- The CSS modules access rights have been extended to include "*Change module*" right: in the properties dialog all values can be changed. This functionality requires the IQ version V7.0 - 0100 or newer. Note: If this right is set, IQ versions before V7.0 - 0100 will interpret this as "*no rights*". [CARM-158]

Service Pack 5.7 - 0040

General:

- The e-mail to module users about newer module versions was sent with the wrong encoding. In some e-mail programs the e-mail was not readable. This has been fixed. [CARM-150]

Service Pack 5.7 - 0030

General:

- If a standard status for uploaded modules is used, this status of that module can no longer be changed using the IQ-Software. This functionality requires V7.0 - 0040 and up. [CARM-133]

- When CSS Module Access Rights Service is active, a user with all access rights may administer certificates. Using the new option "*Only the CARM Server administrator is allowed to delete certificates*" (CARM-Server Settings | CSS Modules), this user can be blocked from deleting certificates from within the IQ-Software. This functionality requires V7.0 - 0040 and up. [CARM-137]

CSA WEB/PDF Publisher:

- If provided, the file "*logo.png*" will be used as the default logo for CSA exports. The file must be located in the CARM Server data path in the "*workgroup*" directory. [CARM-21]

- CSA Web Publisher: The company logo is now displayed in the header. Additionally, the file "*WebPublisher.css*" can be stored in the CARM Server data path in the "*workgroup*" directory as a template for a central and user-defined HTML style sheet. This is used for all newly created Web Publisher jobs. [CARM-139]

Service Pack 5.7 - 0020

General:

- Less memory is now consumed when converting the module database. [CARM-121]
